

From Nand to Tetris in 12 Steps

The Elements of Computing Systems: Building a Modern Computer From First Principles

Noam Nisan and Shimon Schocken, MIT Press, 2005

The Computer Science Curriculum

Some Open Issues:

- Lack of integration
- Lack of comprehension

Our Solution:

- A new, integrative capstone course
- Textbook: *The Elements of Computing Systems*
Nisan and Schocken, MIT Press 2005.

Course Contents

- **Hardware**: Logic gates, Boolean arithmetic, multiplexors, flip-flops, registers, RAM units, counters, Hardware Description Language, chip simulation and testing.

Hardware

- **Architecture**: ALU/CPU design and implementation, machine code, assembly language programming, addressing modes, memory-mapped input-output (I/O).

- **Data structures and algorithms**: Stacks, heaps, queues, sorting, arithmetic algorithms, geometric algorithms, graph algorithms, etc.

Algorithms

- **Programming Languages**: Object-based design and programming, abstract data types, scoping rules, syntax and semantics, references, OS libraries.

- **Compilers**: Lexical analysis, top-down parsing, symbol tables, virtual stack-based machine, code generation, implementation of various constructs.

Systems

- **Software Engineering**: Modular design, the layered implementation paradigm, API design and documentation, proactive test planning, quality assurance, programming at the large.

The Course Theme: Let's Build a Computer

Course Goals

- **Explicit:** Let's build a computer!
- **Implicit:** Understand ...
 - Key hardware & software abstractions
 - Key interfaces: compilation, VM, O/S
- **Appreciate:** Science history and method
- **Plus:** Have fun.

Course Methodology

- **Constructive:** do-it-yourself
- **Self-contained:** only requirement is programming
- **Guided:** all "plans" are given
- **Focused:** no optimization,
no exceptions,
no advanced features.

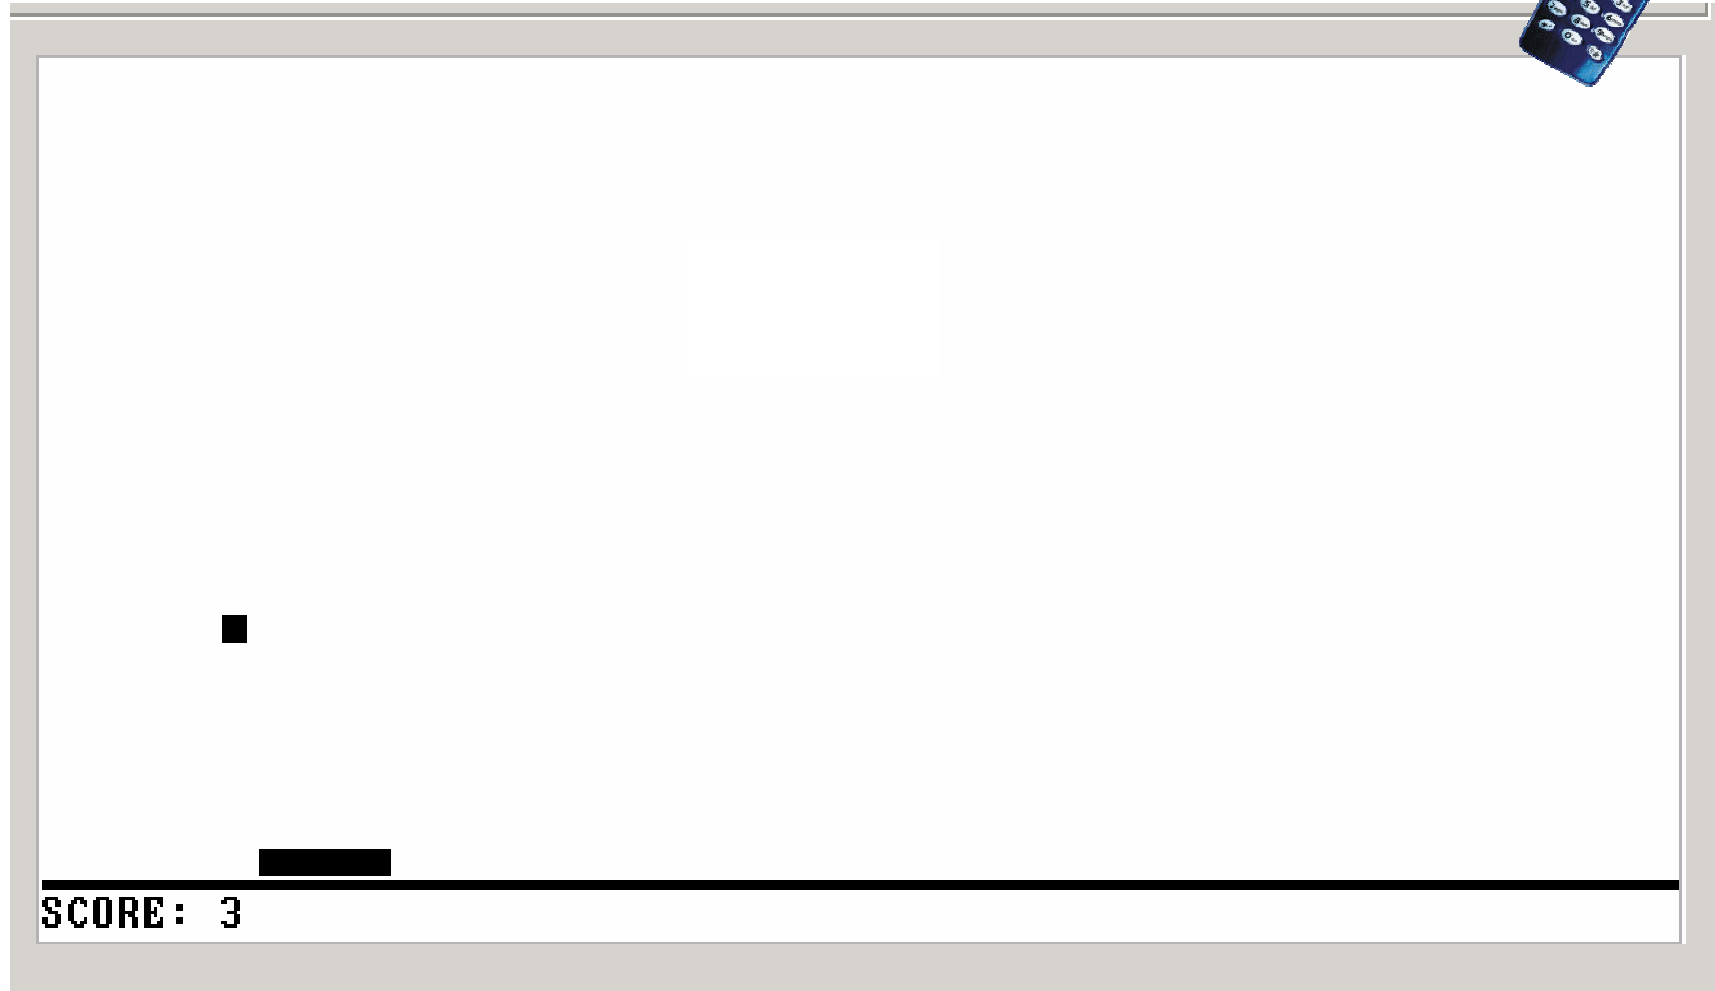

Sample Applications

```
Enter the students data, ending with 'Q':  
Name: DAN  
Grade: 90  
  
Name: PAUL  
Grade: 80  
  
Name: LISA  
Grade: 100  
  
Name: ANN  
Grade: 90  
  
Name: Q  
  
The grades average is 90  
The student with the highest grade is LISA
```

Hardware projects

hardware platform

Hardware projects:

- P1: Elementary logic gates
- P2: Combinational gates (ALU)
- P3: Sequential gates (memory)
- P4: Machine language
- P5: Computer architecture

Tools:

- HDL (Hard. Descr. Language)
- Test Description Language
- Hardware simulator.

Project 1: Elementary logic gates

Given: $\text{Nand}(a,b)$, false

■ $\text{Not}(a) = \text{Nand}(a,a)$

■ $\text{true} = \text{Not}(\text{false})$

■ $\text{And}(a,b) = \text{Not}(\text{Nand}(a,b))$

■ $\text{Or}(a,b) = \text{Not}(\text{And}(\text{Not}(a), \text{Not}(b)))$

■ $\text{Mux}(s,a,b) = \text{Or}(\text{And}(s,a), \text{And}(\text{Not}(s), b))$

■ Etc. - 12 gates altogether.

a	b	$\text{Nand}(a,b)$
0	0	1
0	1	1
1	0	1
1	1	0

Building an And gate

And.cmp

a	b	out
0	0	0
0	1	0
1	0	0
1	1	1

Contract:

When running your .hdl on our .tst, your .out should be the same as our .cmp.

And.hdl

```
CHIP And
{
  IN  a, b;
  OUT out;
  // implementation missing
}
```

And.tst

```
load And.hdl,
output-file And.out,
compare-to And.cmp,
output-list a b out;
set a 0, set b 0, eval, output;
set a 0, set b 1, eval, output;
set a 1, set b 0, eval, output;
set a 1, set b 1, eval, output;
```

Building an And gate

Interface: $\text{And}(a,b) = 1$ exactly when $a=b=1$

And.hdl

```
CHIP And
{
  IN  a, b;
  OUT out;
  // implementation missing
}
```

Building an And gate

Implementation: $\text{And}(a,b) = \text{Not}(\text{Nand}(a,b))$

And.hdl

```
CHIP And
{
  IN  a, b;
  OUT out;
  // implementation missing
}
```

Building an And gate

Implementation: $\text{And}(a,b) = \text{Not}(\text{Nand}(a,b))$

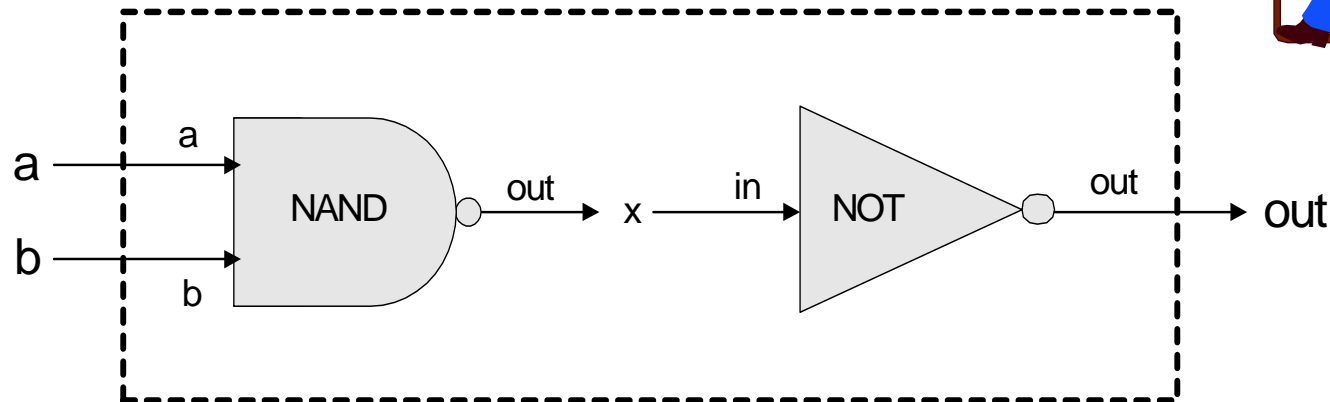

And.hdl

```
CHIP And
{
  IN  a, b;
  OUT out;
  // implementation missing
}
```

Building an And gate

Implementation: $\text{And}(a,b) = \text{Not}(\text{Nand}(a,b))$

And.hdl

```
CHIP And
{
  IN  a, b;
  OUT out;
  Nand(a = a,
        b = b,
        out = x);
  Not(in = x, out = out)
}
```

Hardware simulator

The screenshot shows a hardware simulator window titled "Hardware Simulator - D:\hack\Chips\Project 1\Xor.hdl". The interface includes a menu bar (File, View, Run, Help), a toolbar with simulation controls (a red circle highlights the "Run" button), and several panels:

- Input pins:** A table with columns "Name" and "Value".

Name	Value
a	0
b	0
- Output pins:** A table with columns "Name" and "Value".

Name	Value
out	0
- HDL:** A text area containing Verilog code for an XOR gate.

```
// Xor (exclusive or) gate
// if a<>b out=1 else out=0
CHIP Xor {
  IN a,b;
  OUT out;
  PARTS:
    Not (in=a,out=nota);
    Not (in=b,out=notb);
    And (a=a,b=notb,out=x);
    And (a=nota,b=b,out=y);
    Or (a=x,b=y,out=out);
}
```
- Internal pins:** A table with columns "Name" and "Value".

Name	Value
nota	1
notb	1
x	0
y	0
- test script:** A text area containing a script for testing the chip.

```
load Xor,
output-file Xor.out,
compare-to Xor.cmp,
output-list a%B3.1.3 b%B3.1.3 out%B3.1.3;

set a 0,
set b 0,
eval,
output;

set a 0,
set b 1,
eval,
output;

set a 1,
set b 0,
eval,
output;

set a 1,
set b 1,
eval,
output;
```
- gate diagram:** A logic diagram showing the implementation of the XOR gate using two AND gates and one OR gate. Inputs 'a' and 'b' are connected to the AND gates. The outputs of the AND gates are connected to the OR gate, which produces the output 'out'.

Three orange callout boxes with red dots point to the HDL code, the test script, and the gate diagram, labeled "HDL program", "test script", and "gate diagram" respectively. A status bar at the bottom left indicates "Script restarted".

Hardware simulator

The screenshot shows a window titled "Hardware Simulator - D:\hack\Chips\Project 1\Xor.hdl". The interface includes a menu bar (File, View, Run, Help), a toolbar with icons for simulation control (a red circle highlights the "Run" icon), and a status bar at the bottom that reads "Script restarted".

The main workspace is divided into several sections:

- Chip Name:** A text field containing "Xor.hdl" and a "Time:" field showing "0".
- Input pins:** A table with columns "Name" and "Value".

Name	Value
a	0
b	0
- Output pins:** A table with columns "Name" and "Value".

Name	Value
out	0
- Internal pins:** A table with columns "Name" and "Value".

Name	Value
nota	1
notb	1
x	0
y	0
- HDL:** A text area containing the following code:

```
// Xor (exclusive or) gate
// if a<>b out=1 else out=0
CHIP Xor {
  IN a,b;
  OUT out;
  PARTS:
  Not (in=a,out=nota);
  Not (in=b,out=notb);
  And (a=a,b=notb,out=x);
  And (a=nota,b=b,out=y);
  Or (a=x,b=y,out=out);
}
```
- Script Editor:** A large text area on the right containing a sequence of commands:

```
Load Xor,
output-file Xor.out,
compare-to Xor.cmp,
output-list a%B3.1.3 b%B3.1.3 out%B3.1.3;

set a 0,
set b 0,
eval,
output;

set a 0,
set b 1,
eval,
output;

set a 1,
set b 0,
eval,
output;

set a 1,
set b 1,
eval,
output;
```

Hardware simulator

The screenshot shows a hardware simulator window titled "Hardware Simulator - D:\hack\Chips\Project 1\Xor.hdl". The interface includes a menu bar (File, View, Run, Help), a toolbar with simulation controls (play, stop, fast, slow), and a "View" dropdown menu currently set to "Script".

On the left side, there are two tables:

Input pins		Output pins	
Name	Value	Name	Value
a	1	out	0
b	1		

Below these tables is a callout box labeled "HDL program" pointing to the HDL code area. The HDL code is as follows:

```
// Xor (exclusive or) gate
// if a<>b out=1 else out=0
CHIP Xor {
  IN a,b;
  OUT out;
  PARTS:
    Not (in=a,out=nota);
    Not (in=b,out=notb);
    And (a=a,b=notb,out=x);
    And (a=nota,b=b,out=y);
    Or (a=x,b=y,out=out);
}
```

At the bottom left, there is a table for "Internal pins":

Name	Value
nota	0
notb	0
x	0
y	0

The main area on the right displays the script being executed:

```
load Xor,
output-file Xor.out,
compare-to Xor.cmp,
output-list a%B3.1.3 b%B3.1.3 out%B3.1.3;

set a 0,
set b 0,
eval,
output;

set a 0,
set b 1,
eval,
output;

set a 1,
set b 0,
eval,
output;

set a 1,
set b 1,
eval,
output;
```

A callout box labeled "output file" points to the "output;" line in the script. Below the script, a truth table is displayed, with the last row highlighted in yellow:

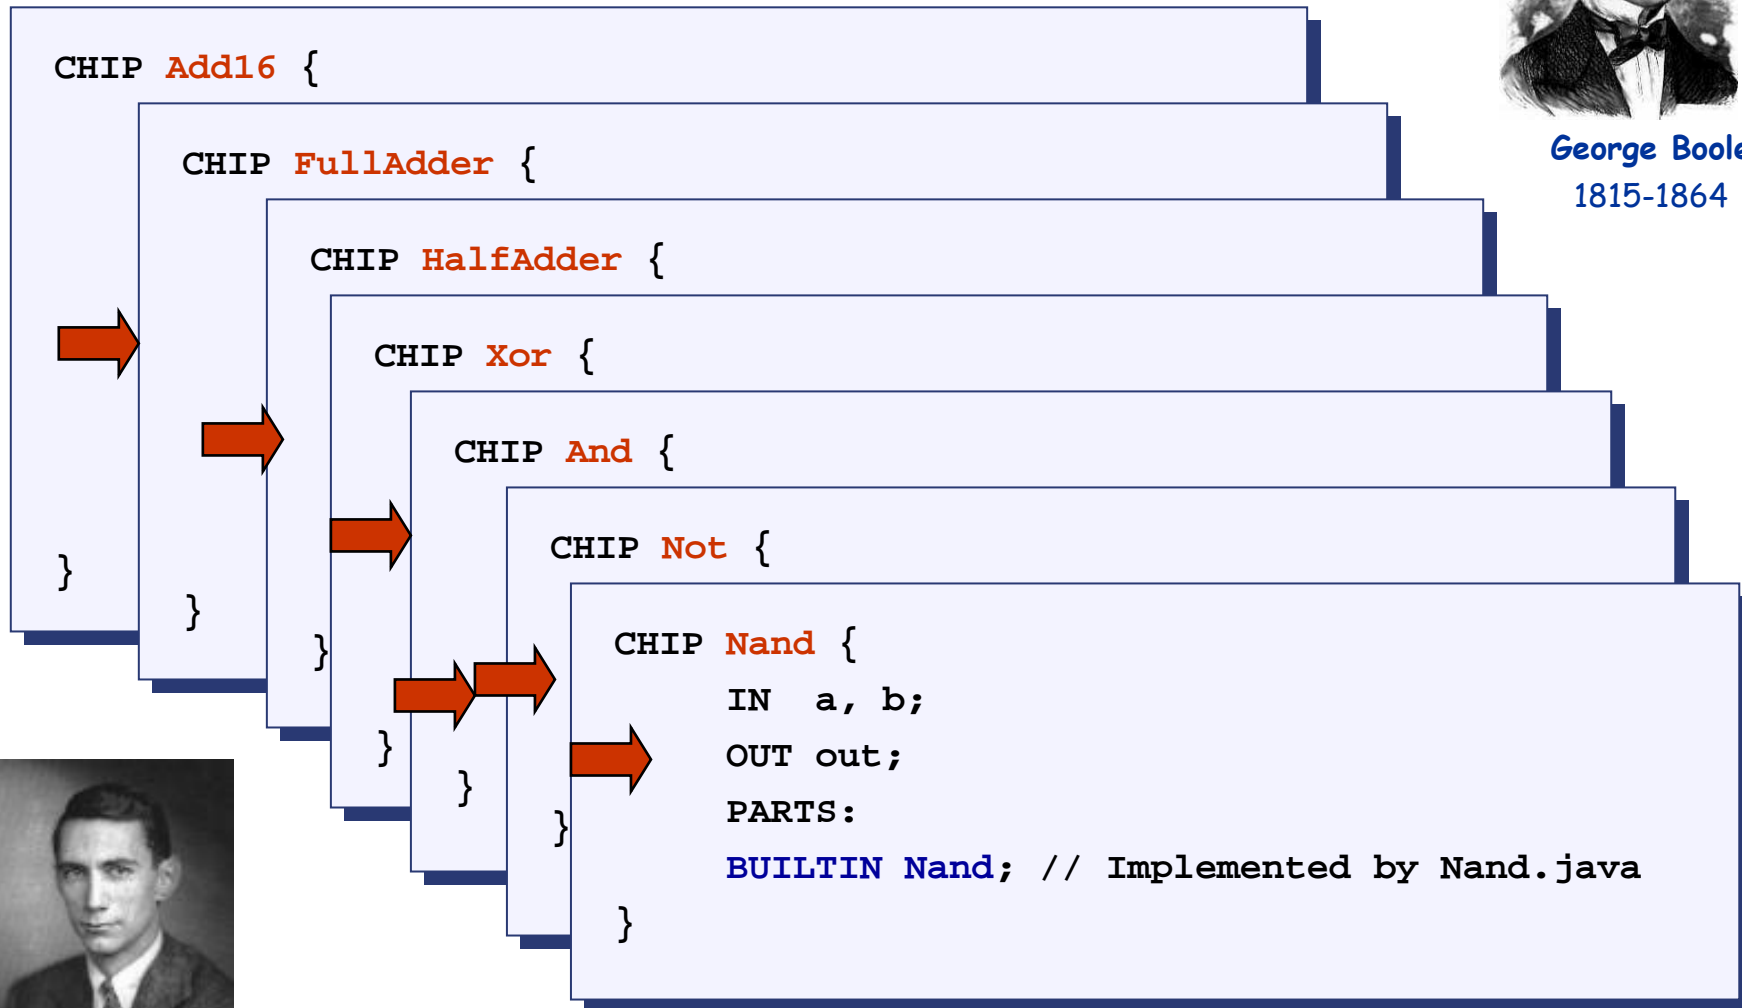

a	b	out
0	0	0
0	1	1
1	0	1
1	1	0

At the bottom of the window, a status bar reads "End of script - Comparison ended successfully".

Chip anatomy

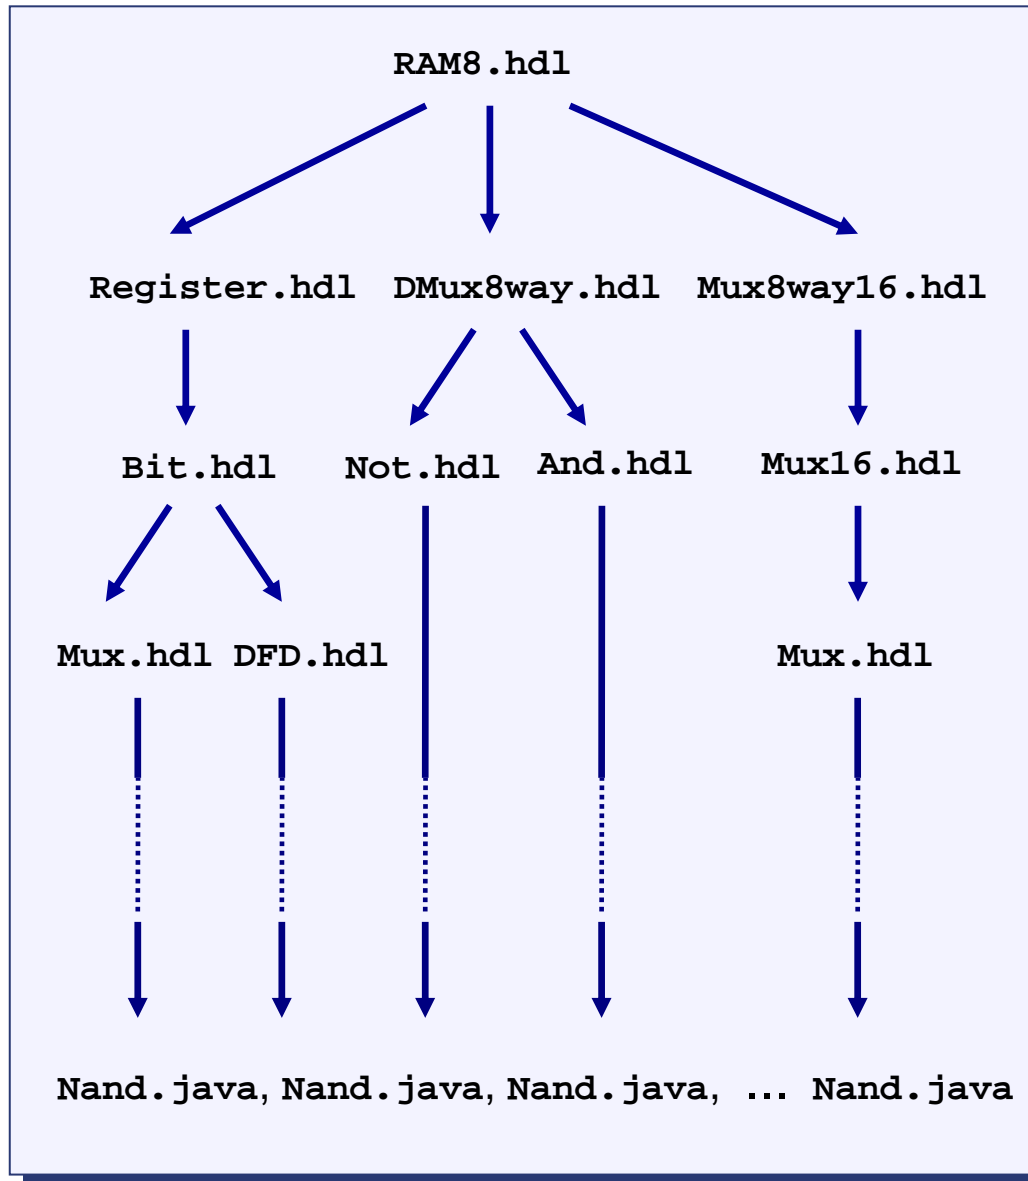

George Boole
1815-1864

Claude Shannon, 1916-2001

Chip anatomy

Simulator logic:

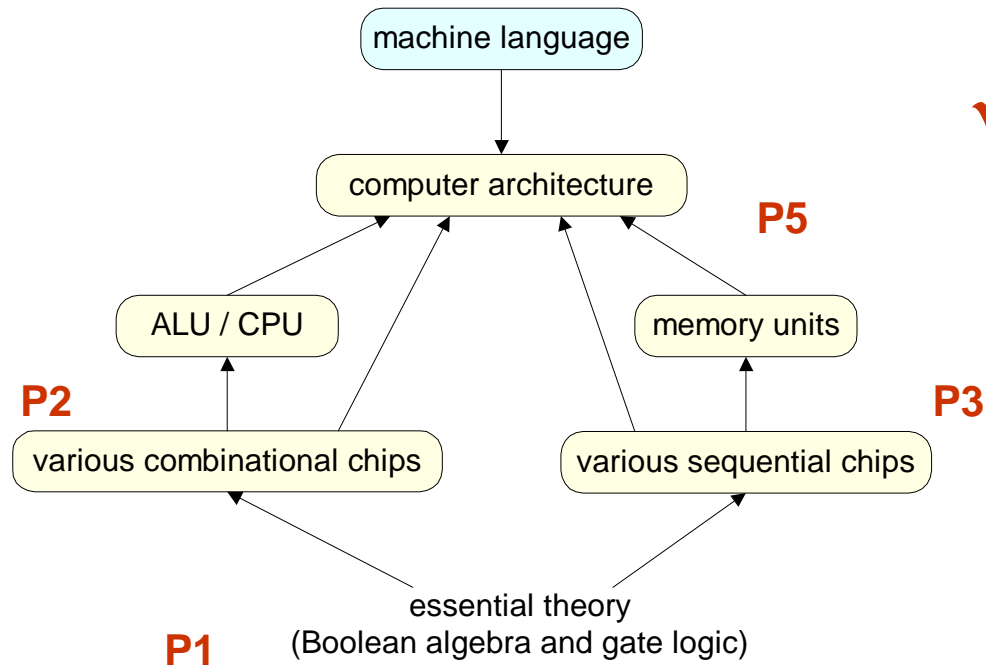

- Top-down expansion
- Nand is primitive (built-in)
- No chip.hdl? chip.java kicks in
- Instructors/architects can supply built-in versions of any chip.

Benefits:

- Behavioral simulation
- Chip GUI
- Order-free implementation
- Partial implementation is OK
- All HW projects are decoupled.

Hardware projects

hardware platform

Hardware projects:

- ✓ ■ P1: Elementary logic gates
- P2: Combinational gates (ALU)
- P3: Sequential gates (memory)
- P4: Machine language
- P5: Computer architecture

Project 2: Combinational chips

$out(x, y, \text{control bits}) =$

Input / Output Devices

Recap: the Hack chip-set and hardware platform

Elementary logic gates

(Project 1):

- Nand (primitive)
- Not
- And
- Or
- Xor
- Mux
- Dmux
- Not16
- And16
- Or16
- Mux16
- Or8Way
- Mux4Way16
- Mux8Way16
- DMux4Way
- DMux8Way

Combinational chips

(Project 2):

- HalfAdder
- FullAdder
- Add16
- Inc16
- ALU

Sequential chips

(Project 3):

- DFF (primitive)
- Bit
- Register
- RAM8
- RAM64
- RAM512
- RAM4K
- RAM16K
- PC

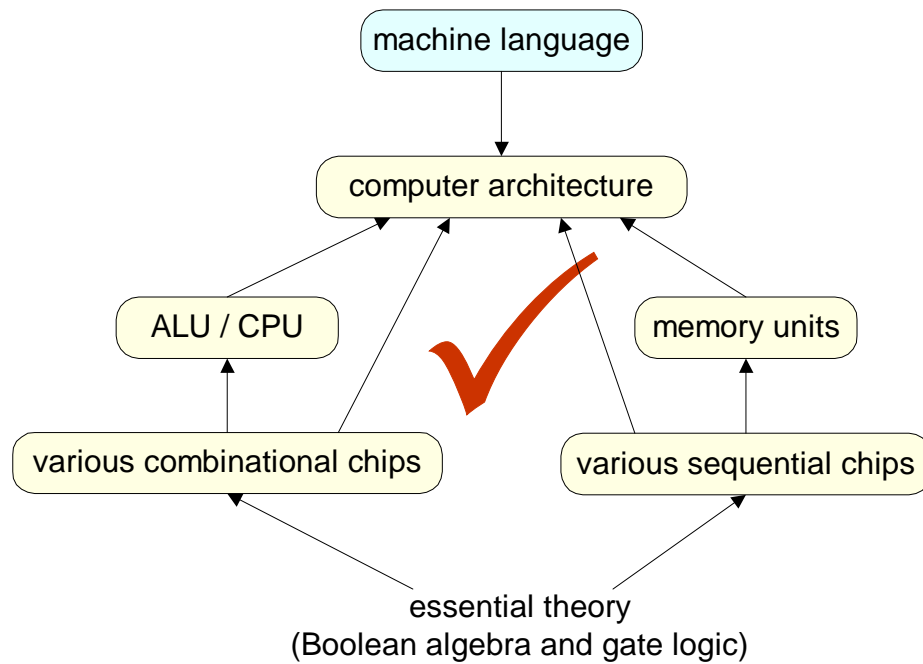

Computer Architecture

(Project 5):

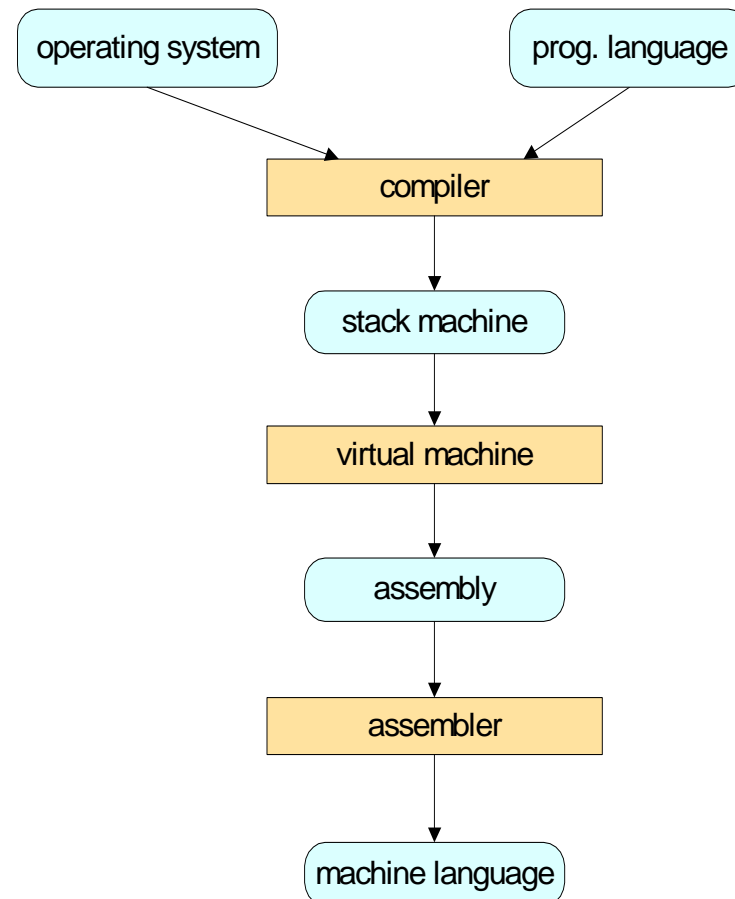

- Memory
- CPU
- Computer

Assembler in action

The screenshot shows an assembler window titled "Assembler - D:\hack\shimon progs\sumto100.asm". The window has a menu bar with "File", "Run", and "Help". Below the menu bar is a toolbar with icons for file operations and execution. The main area is divided into two panes: "Source" and "Destination".

Source Code:

```
// computes sum=1+...+100
@1
M=1 // count=1
@sum // allocated at RAM[16]
M=0
(LOOP)
@1
D=M
@100
D=D-A // if count=100 ...
@END
D;JGT // goto end
@1
D=M
@sum
M=D+M // sum=sum+count
@1
M=M+1 // count=count+1
@LOOP
0;JMP
(END) // infinite loop
@END
0;JMP
```

Destination (Binary Output):

1111110000010000
0000000000010000
1111000010001000
0000000000000001
11111011011001000
0000000000000100
1110101010000111
0000000000010010
1110101010000111
```

A blue arrow points from the source code to the binary output. A hand-drawn sign on the right says "Project 6: Build an assembler".

File compilation succeeded

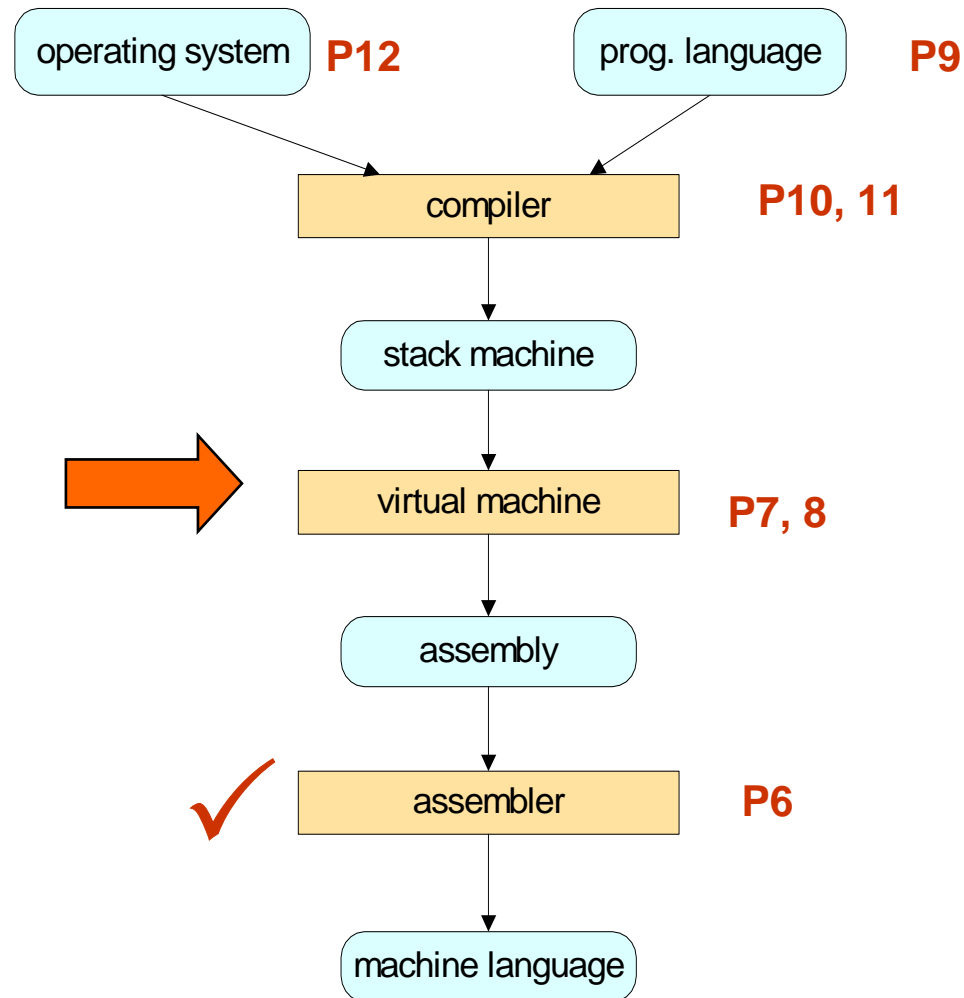

CPU Emulator

The screenshot shows a CPU Emulator window titled "CPU Emulator - D:\hack\instructor\Examples\rect\rect.asm". The interface includes a menu bar (File, View, Run, Help), a toolbar with navigation and execution controls, and a main workspace divided into several sections:

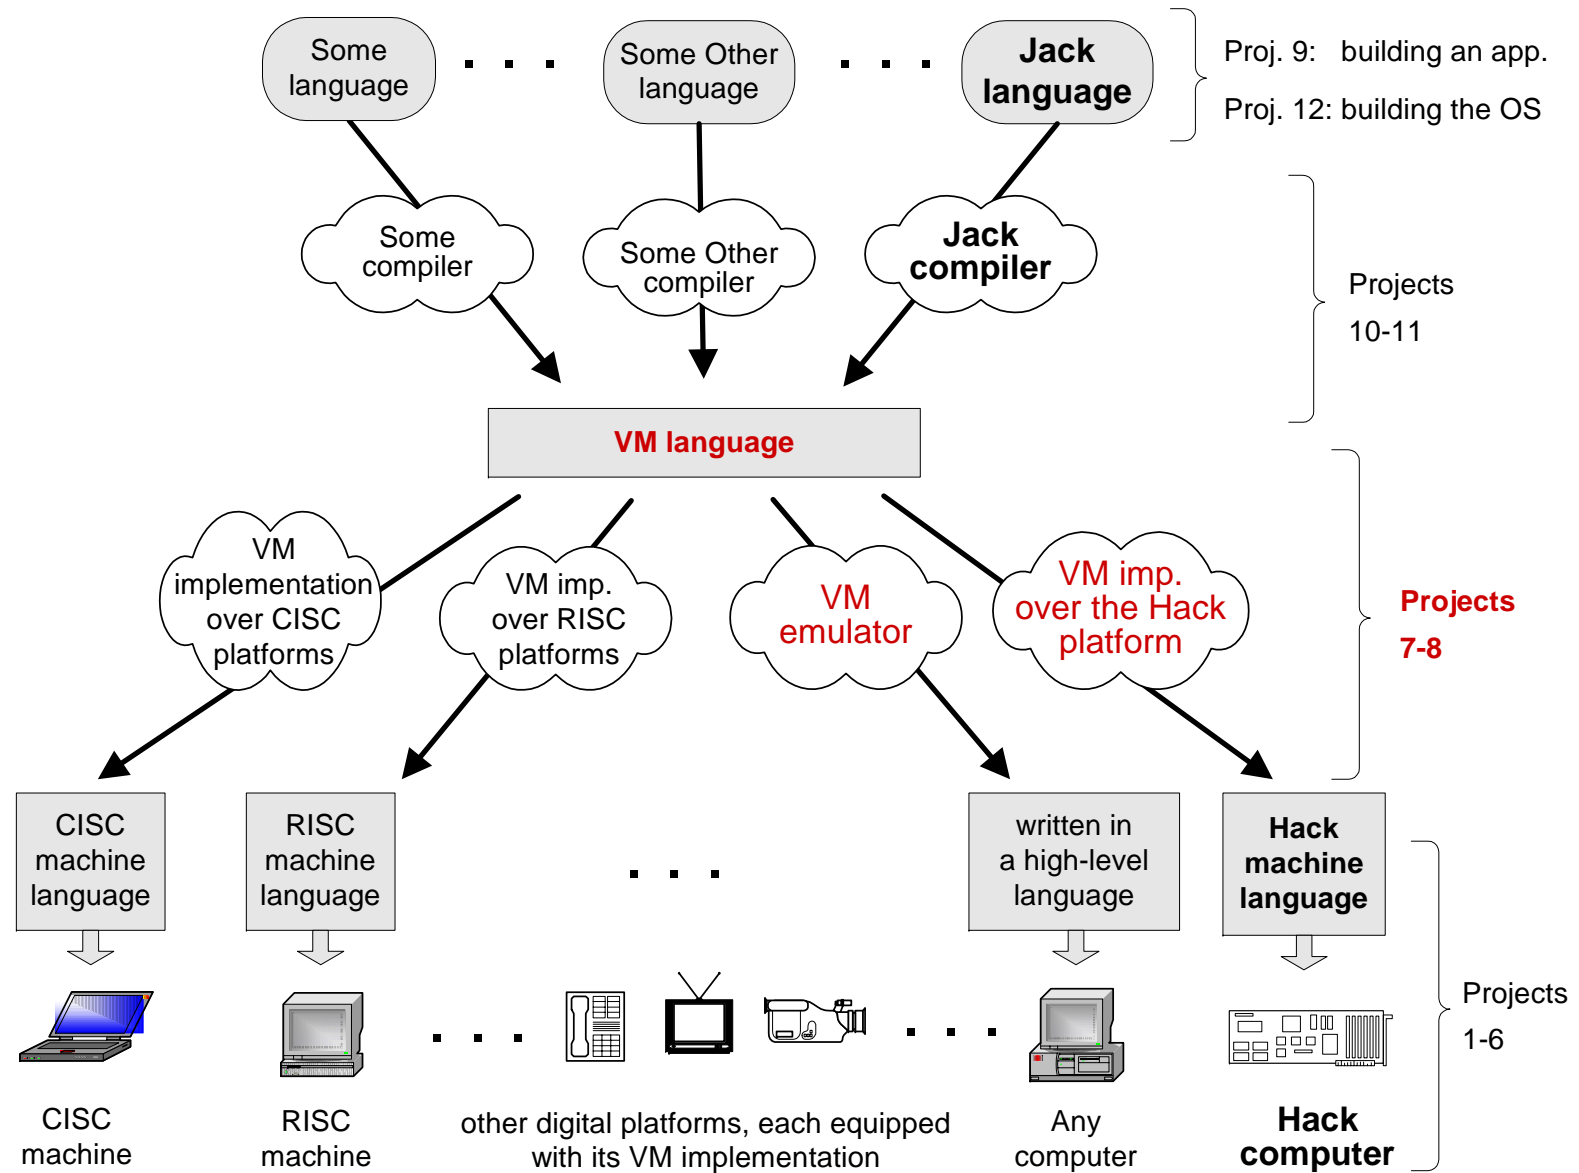

- ROM Asm:** A list of assembly instructions. Instruction 12, "M=-1", is highlighted in yellow. An orange callout box labeled "instruction memory" points to this instruction.
- RAM:** A memory dump table. Address 17 contains the value 17536. An orange callout box labeled "data memory" points to this entry.
- 256 by 512 pixels simulated screen:** A large white rectangular area representing the screen.
- keyboard enabler:** A horizontal bar with a keyboard icon, used to simulate keyboard input.
- Data register:** A field labeled "D" containing the value 14. An orange callout box labeled "Data register" points to it.
- ALU:** A diagram of an ALU with a green trapezoidal shape. It has two inputs: "D Input" (14) and "M/A Input" (17536). The output is "ALU output" (17536). An orange callout box labeled "ALU" points to the diagram.
- program counter:** A field labeled "PC" containing the value 12. An orange callout box labeled "program counter" points to it.
- address register:** A field labeled "A" containing the value 17536. An orange callout box labeled "address register" points to it.

Projects 7,8: Implement the VM over the Hack platform

Mult.vm

```
function mult 2    // 2 local variables
  push constant 0 // result=0
  pop local 0
  push argument 1 // j=y
  pop local 1
label loop
  push constant 0 // if j==0 goto end
  push local 1
  eq
  if-goto end
  push local 0    // result=result+x
  push argument 0
  add
  pop local 0
  push local 1    // j=j-1
  push constant 1
  sub
  pop local 1
  goto loop
label end
  push local 0    // return result
  return
```

VM Translator

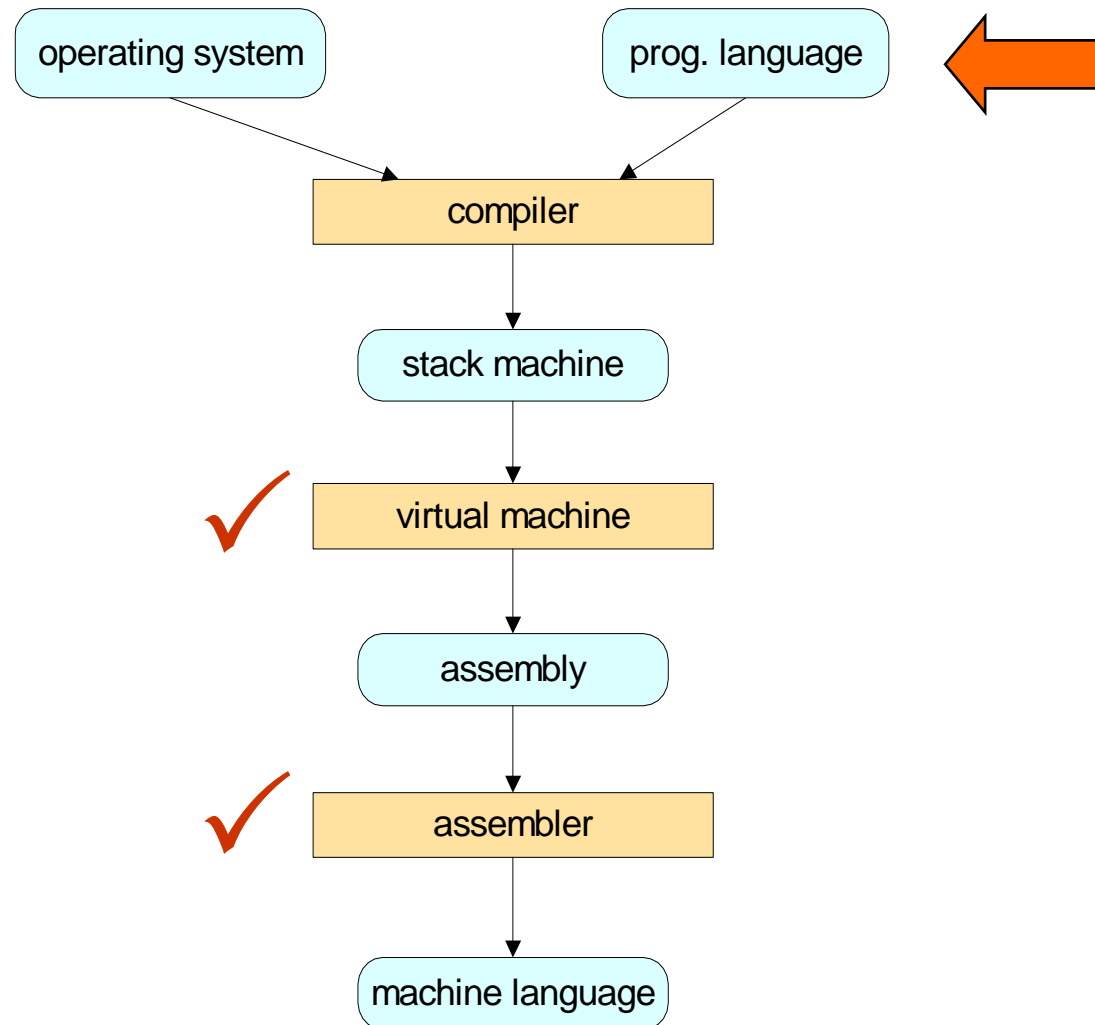

Mult.asm

```
...
A=M-1
M=0
@5
D=A
@LCL
A=M-D
D=M
@R6
M=D
@SP
AM=M-1
D=M
@ARG
A=M
M=D
D=A
@SP
M=D+1
@LCL
D=M
...
```

Jack Language

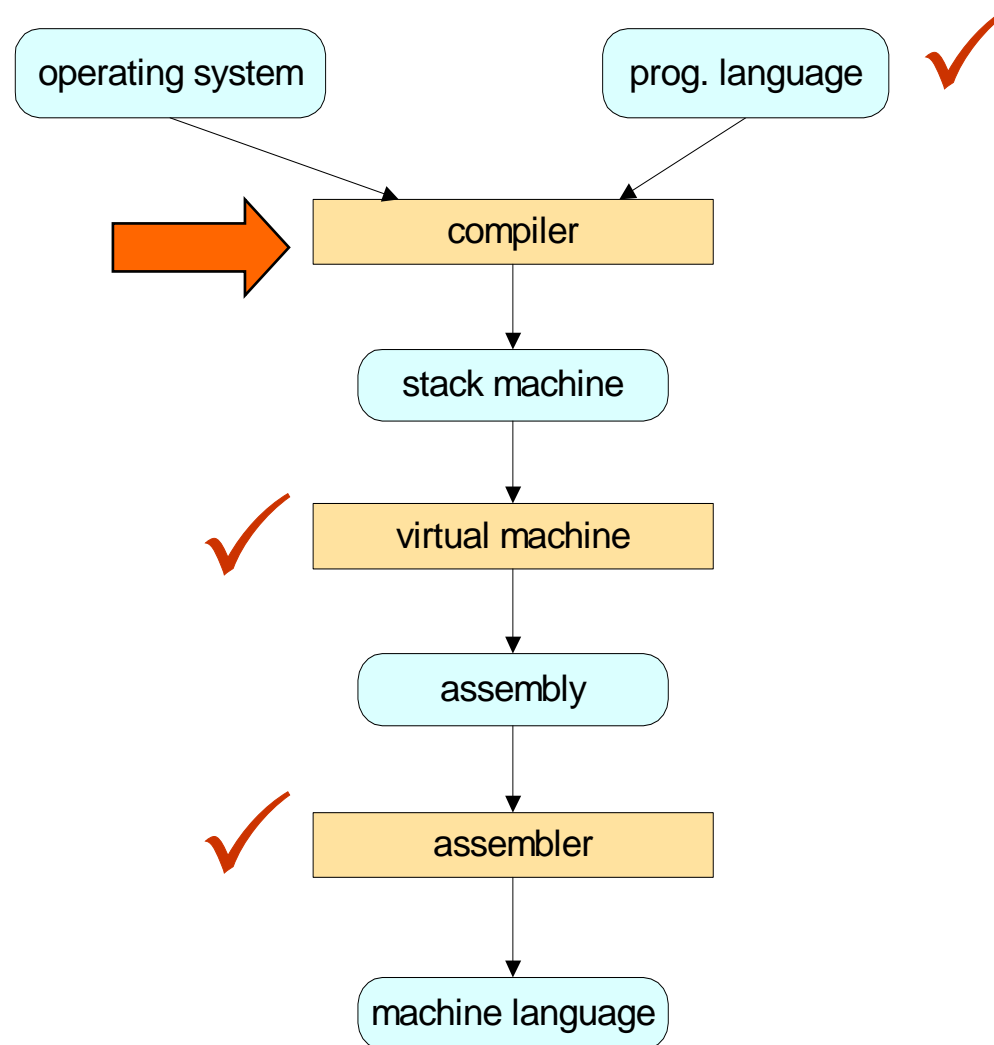

```
class Math {  
  
    /** Returns n! */  
    function int factorial(int n){  
        if (n = 0) {  
            return 1;  
        }  
        else {  
            return n * Math.factorial(n - 1);  
        }  
    }  
  
    /** Returns e=sigma(1/n!) where n goes from 0 to infinity */  
    function Fraction e (int n){  
        var int i;  
        let i = 0;  
        let e = Fraction.new(0,1); // start with e=0  
        // approximate up to n  
        while (i < n) {  
            let e = e.plus(Fraction.new(1, Math.factorial(i)));  
            let i = i + 1;  
        }  
        return e;  
    }  
  
    ...  
} // end Math
```

Project 9: Write a Jack program

Demo Pong

Software projects

Typical Jack code

```
/** Computes the average of a sequence of integers. */
class Main {
  function void main() {
    var Array a;
    var int length;
    var int i, sum;

    let length = Keyboard.readInt("How many numbers? ");
    let a = Array.new(length); // Constructs the array
    let i = 0;

    while (i < length) {
      let a[i] = Keyboard.readInt("Enter the next number: ");
      let sum = sum + a[i];
      let i = i + 1;
    }

    do Output.println("The average is: ");
    do Output.printInt(sum / length);
    do Output.println();
    return;
  }
}
```

OS Libraries

- **Math:** Provides basic mathematical operations;
- **String:** Implements the `string` type and string-related operations;
- **Array:** Implements the `Array` type and array-related operations;
- **Output:** Handles text output to the screen;
- **Screen:** Handles graphic output to the screen;
- **Keyboard:** Handles user input from the keyboard;
- **Memory:** Handles memory operations;
- **Sys:** Provides some execution-related services.

OS API

```
class Math {
```

```
  Class String {
```

```
    Class Array {
```

```
      class Output {
```

```
        Class Screen {
```

```
          class Memory {
```

```
            Class Keyboard {
```

```
              Class Sys {
```

```
                function void halt():
```

```
                function void error(int errorCode)
```

```
                function void wait(int duration)
```

```
              }
```

```
            }
```

```
          }
```

```
        }
```

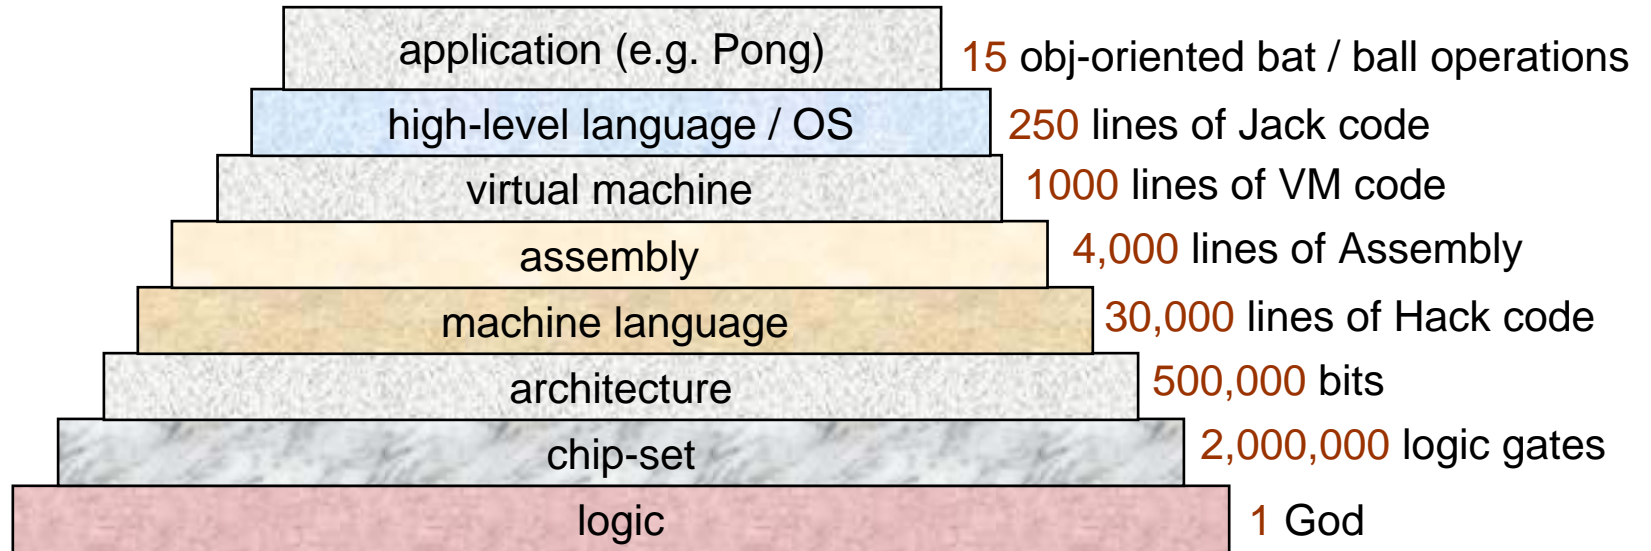

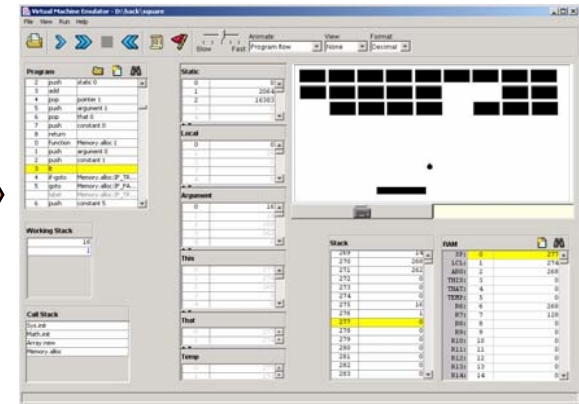

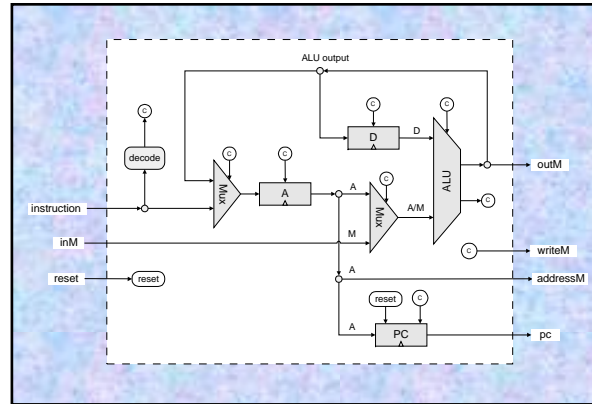

```
      }
```

```
    }
```

```
  }
```

```
}
```

Recap

God gave us 0 and Nand

Everything else was done by humans.

Why the approach works

Take home

- Initial goal: Acquire enough hands-on knowledge for building a computer system
- Final lesson: This includes some of the most beautiful topics in applied CS

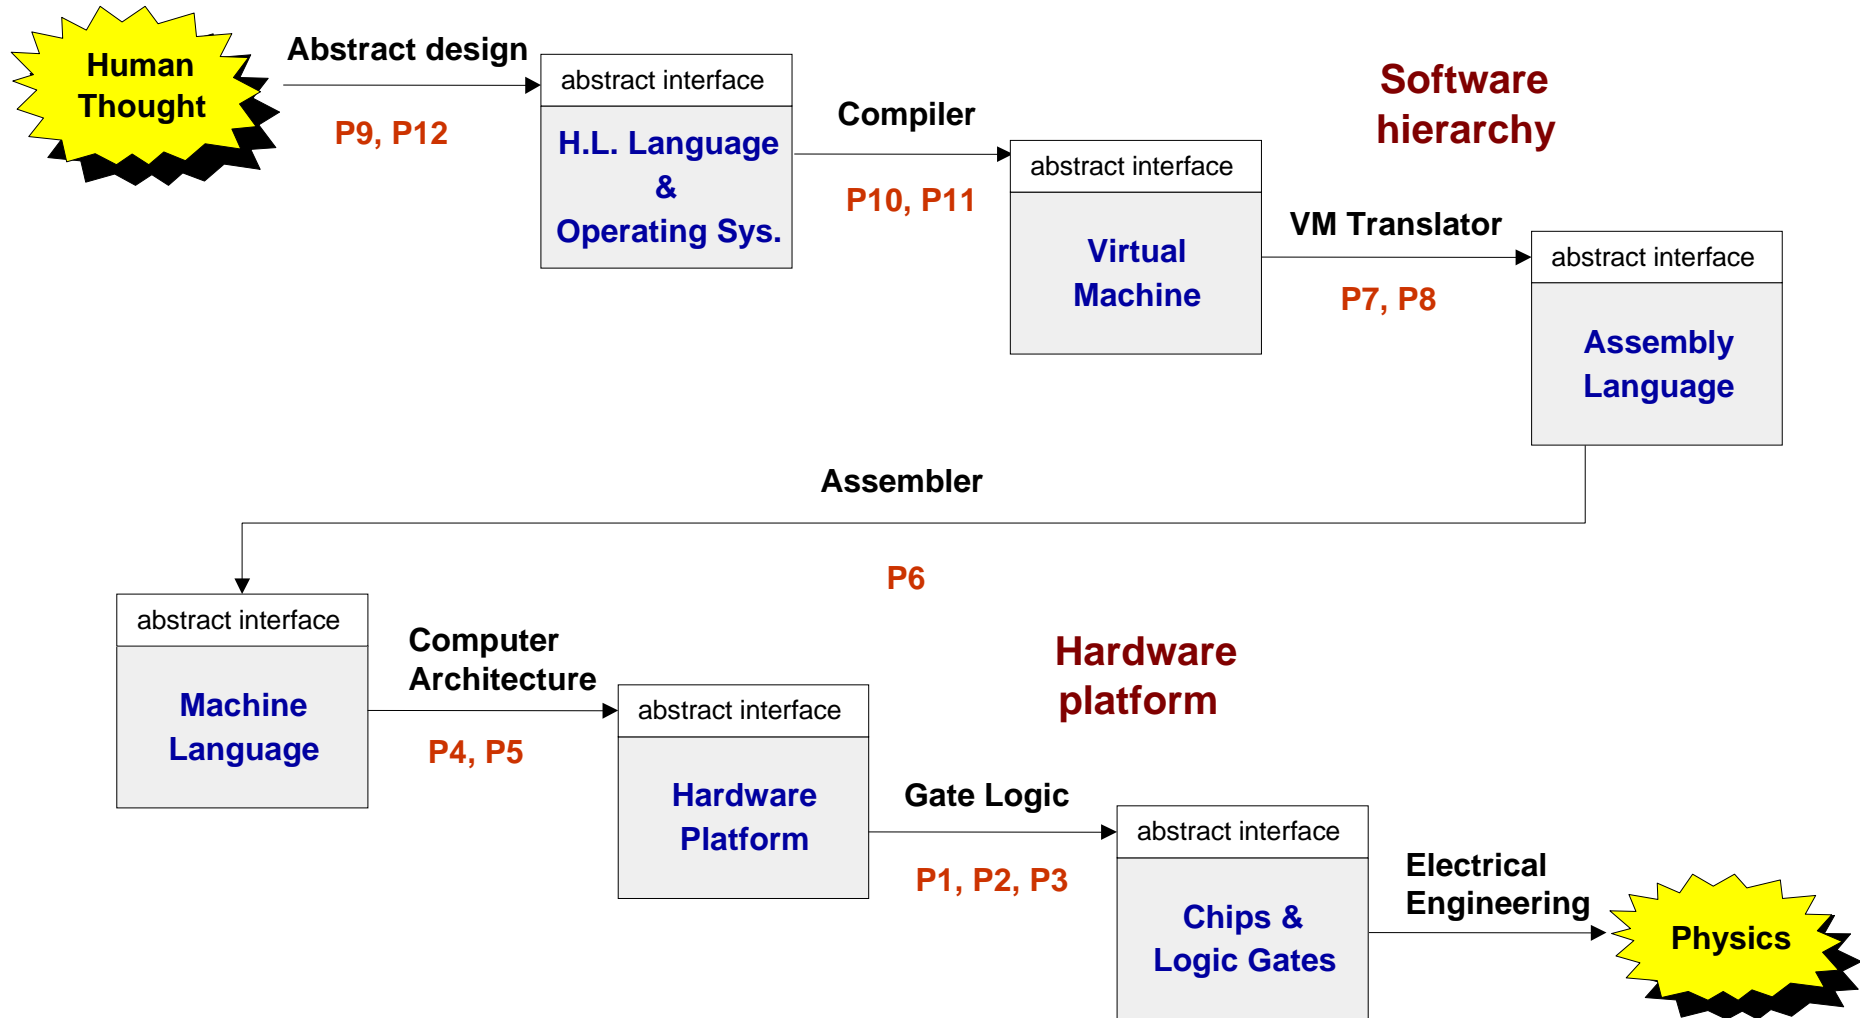

Occam razor

- No optimization
- No advanced features
- No exceptions

Highly-Managed

- Detailed API's are given
- Hundreds of test files and programs
- Modular projects, unit-testing.

Abstraction–Implementation Paradigm
